

Abstract

Storage device for storing contact lenses and contact lens solution including a case defining a reservoir for contact lens solution and a pair of contact lens retaining compartments for retaining contact lenses. The case includes a mechanism for causing a stream of contact lens solution to flow from the reservoir to an exterior of the case (for use when rinsing and/or cleaning the contact lens) and another mechanism for causing the contact lens solution to flow from the reservoir into the compartments (for use when storing the contact lenses in the compartments). These mechanisms can be alternatively enabled depending on the particular use sought for the contact lens solution.
